

Experiencing Dry Eyes After Lasik

As with anything in life, there are complications and risks. Dry eyes after Lasik is one of the risks associated with the procedure of Lasik eye surgery. If you experience dry eyes after Lasik, you know how it can be to have that type of symptom get in the way of your daily life. With the right medication, perhaps some eye drops and pills, you can overcome the dry eyes after Lasik and get on the way to recovery in no time. Without the recovery elements in place, however, you might be in for more complications as the results that come from dry eyes could get in the way of the natural healing process of your eyes.

Your eyes take time to recover and recuperate from the Lasik procedure. With dry eyes, you may experience a delay in that recovery time and may need to have some further assistance in getting to the point at which your eyes can recover from the procedure. As you learn more about the procedure and about dry eyes after the procedure, you can start talking to your doctor before the procedure about what to do if you experience dry eyes after Lasik and what to do after you cure your dry eyes. There is a policy and a procedure to follow that most doctors outline before any procedure of this type. Make sure you go over the procedure with your doctor.

Working Through It

A lot of doctors will not operate on someone that they feel is a high risk for dry eyes. If you have experienced dry eyes before you head in for a Lasik procedure, the doctor will likely disqualify you from any Lasik treatments or any other refractive procedures for your eyes. With this knowledge in mind, the doctor can make the best possible decision for your eyes and for your health. This is what is best for you and while you may feel that you would rather have the eye operation, the doctor is in charge of risk assessment and your health primarily.

It is common to experience dry eyes after Lasik. The important issue about the experience is to what degree and for what duration, so consider this when you talk to your doctor. The degree of dry eyes in most cases is not significant enough to impede your activity or cause any other complications. Most dry eye symptoms will resolve themselves automatically with a small period of time, so patience is your best ally. If that is not the case, you may want to consult your physician for assistance.
