

Registry Smart: The Importance of an Error-Free PC

I work at an interactive marketing agency in the Boston area. For those of you who don't know, working at an agency means long hours and late nights. Being a bit of a techie guy, I have a pretty advanced setup at home, at least to the point that I'm still running Windows and not Linux, but that's another story. So I spend a lot of nights working from home on projects for my Fortune 1000 clients, and that means tight deadlines and a lot of money on the table. It also means that I depend on my computer, a lot, so it needs to be running in tip-top shape.

I didn't always take such good care of my computer, however. One particular evening, I was working on a project and the unthinkable happened. It was late, very late, and had spent the better part of an evening at my computer. I was getting ready to call it a night and decided to take one last look at my presentation. When I went to open it, however, I received an error window and my computer shut off. Upon restarting, I got another error and the computer turned off again, before it even finished booting windows! Now I had a problem on my hands. Several hours of work on a presentation were being held hostage on my computer, and this was due in the morning. It took a couple hours of tinkering before I could copy the file to another location and retrieve it there, but thankfully I got it.

The next day, when I had some time to address the cause of the error instead of just frantically trying to rescue data, I managed to get windows to finishing loading. After that, however, I was lost. I had o idea what was causing the error or how to fix it. I really didn't want to reinstall windows or buy a new computer, so I started doing some research online. It was then that I learned about registry cleaners. Registry cleaners scan your Windows registry for invalid entries that inevitably happen over time. These invalid entries cause many of the problems that most people have with their computers. Whether it's running slow, giving you error messages or shutting down suddenly, all this can usually be fixed by repairing your Windows registry.

I've now invested in a registry cleaner, called Registry Smart, which I use on a regular basis to keep my computer running smoothly. I no longer have any computer trouble, which gives me the peace of mind to focus on what's really important, my clients!
