

What are the three main symptoms to lung cancer?

The main three symptoms to lung cancer that should not be ignored are shortness of breath, pain when breathing or coughing, and existence of a persistent cough, especially if it is accompanied by expectoration of sputum streaked with blood. Additionally, loss of appetite, fatigue, unusual losses of weight are three symptoms, which are indicative of lung cancer.

Because of the non-specific nature of symptoms of Mesothelioma, Mesothelioma tests are imperative to rule out incidence of the disease when lung cancer symptoms show up. Early detection of Mesothelioma cancer substantiated by clear information of patient's exposure to asbestos can help define the course of treatment.

Early Detection Of Mesothelioma Cancer In Long Term Health Prognosis

The length of time between asbestos exposure and onset of lung cancer symptoms can be between 15-50 years. Therefore a complete medical history and information of possible asbestos exposure are critical in identifying patients who are prone for developing Mesothelioma lung cancer.

During physical tests for Mesothelioma lung cancer, the doctor may check breath sounds to see whether there is any indication of fluid in the chest cavity. A variety of diagnostic procedures also help to determine whether a patient has Mesothelioma lung cancer.

Results from imaging scans, tissue biopsies, pulmonary function tests, and other diagnostic techniques, combined with the findings from a careful medical history help to define the course of treatment in Mesothelioma lung cancer.

There are less common but more uncomfortable symptoms of lung cancer, which are usually associated with advanced stages of the disease. Such lung cancer or Mesothelioma patients may exhibit symptoms like a hoarse voice, difficulty swallowing, swelling of the face or in the neck, pain or discomfort under the ribs, and shortness of breath caused by fluid around the lungs.

If you suspect that you or any of your family members have lung cancer symptoms- DO NOT DELAY - consult your physician right away.
