

HDTV - The Future of Television

HDTV is growing in popularity and with good reason....

Many consider HDTV to be one of the greatest inventions since sliced bread. By providing wider pictures with enhanced details and the clear look of a movie screen, it's no wonder so many people are excited about this revolutionary product. In comparison to standard television, HDTV images hold twice the definition both vertically and horizontally and are a full 1/4 wider than a normal television set.

However, the biggest draw for HDTV is its clear picture. Plus, when you add in the the sound quality, you begin to understand why so many folks are rapidly swithching to HDTV. HDTV pictures contains close to 1100 lines in comparison to only 500 in a normal tv set. While you can possibly see the lines in a normal tv set, you will likely not detect the lines in an HDTV set.

There are a few varieties of hdtvs; hd traditional projection tvs, hd flat panel tvs, and hd advanced micro displays. The first is hd traditional projection tvs. This type of hdtv offers larger screen sizes and lower prices, but this hdtv also takes up more space, is quite heavy, and has a thinner viewing angle than other forms of hdtv. Next, is hd flat panel hdtv. This hdtv is thin and lighter and is a type of hdtv that can hang on a wall.

Most of these types of hdtv are HD ready and provide the widest viewing angle and the highest contrast. However, with this hdtv technology usually comes a higher price. Finally, there is the hd advanced micro displays. These hdtvs offer a lightweight design and advanced technology without the expense of flat panel hdtv. These hdtvs are hd ready and provide a big viewing angle, quality contrast, and have a replaceable light sources.

All signs point towards hdtv being the wave of television's future. With it's clarity, sound quality, and wider viewing angle, hdtv will likely become the standard for television viewing and broadcasting in the immediate future.
