

Need For Air Purifiers - A Burden Or A Boon

"Residential Air Cleaning Devices: A Summary of Available Information", this is a document issued by the Environmental Protection Agency (EPA) of the United States to portray before all of you the broader perspective of air pollution that begins from home.

- The sole idea of this organization is to bring before you the importance and essentiality of air purification of the place where you dwell in.
- Now whether you use an air purifier or an air filter or something else is a different issue.
- But in no way you can ignore the aspect of air purification in your home and work place where you spent the maximum hours of a day.

Benefits of air purifier

The Environmental Protection Agency and the American Lung Association have suggested adopting a purification technique that is qualitatively good and user-friendly. Of course money also matters. Thus several alternatives have been raised according to your affording capacity. But they too find the air purifiers to be most suitable from every aspect. The reason is of course related to the quality of cleaning.

- Air purifiers are ten times more efficient than portable air cleaner.
- The calculation is straight and simple. The air cleaners can easily capture pollen, molds, dust particles and other contaminants whose least size is not less than 3 microns. But the air purifiers come with such filtering technique that it can trap pollutants up to 0.3 microns. Thus microbial germs, smog and household smoke and pet allergens can be cleaned up.
- Portable air cleaners are not suitable for patients of asthma, bronchitis and dust allergy. For normal people this can be useful but for minute and specific cleaning you need an air purifier.
- Moreover if sufferers of asthma and allergy are at home, you need to use your air purifier in combination with HEPA air filter and proper ventilation process.

Before you take the decision of buying the air purifier, understand how much it will be suitable for your health.

Invest on the right thing

An air purifier may cost you even more than \$500. At the same time an allergen filter might just take \$15 but do almost everything an air purifier does. This is something you might feel apparently when you set out to decide for buying a purification system. But the difference of hundreds of dollars can't be just let down. There are definitely some crucial features in the air purifier which the allergen filter can't provide.

Here you are.

- Allergen filters can capture small particles of pollen and dust.
- These filters in no way can trap smoke and minute particles less than 3 microns.

Now if you are sure that your home is free from such contaminants you can rely upon the allergen filters. Otherwise just don't pick up the process of air purification for the sake of purification. It's the matter of your health.
