

Jobs with a Purpose: Graduate Jobs in the Green Construction Industry

One of the most explosive industries over the last five years has been in sustainable economic development. Automobile companies are offering smaller, more fuel efficient vehicles along with fleets of hybrid fuel vehicles for environmentally conscious consumers. Furniture retailers are beginning to offer chairs, couches, and tables made of wood grown in responsible forestry preserves. Grocers, restaurants, and major retailers are offering organic food and clothing for customers who want to spend their money more responsibly. However, the most lucrative aspect of the green movement is in green construction. From energy efficient homes to buildings that run on a minimal amount of electricity, billions of pounds are invested annually into green construction.

Graduates with backgrounds in architecture, design, and management should consider breaking into this promising field. The green construction movement is only in its infancy, ensuring long careers for young professionals with the foresight to apply for these jobs. Construction companies of all sizes are beginning to expand their green construction operations, requiring graduates and young professionals interested in learning about this socially responsible field. As well, the possibilities are endless for professionals in the UK who invest their time in this industry. After all, most new commercial and residential buildings and additions will be done with environmental concerns at the forefront.

The skills needed by graduates in the green construction industry are varied and a successful skill set is still developing in this young industry. However, green construction firms are looking for creative, hard working, and committed graduates for design and management jobs. Graduates who can think outside of the box and provide innovative building designs will be successful in the green construction field. Managers, designers, and architects alike need to demonstrate a strong work ethic and an ability to sacrifice some of their time in order to ensure the most environmentally friendly buildings possible. Finally, everyone involved in green construction needs to be committed to the underlying idea of building homes and offices that meet their client's specific needs.

Graduates who enter the green construction field will find a lot of competition but great financial incentives for successful work. The field of applicants is still small for these positions, giving committed graduates the opportunity to showcase their abilities to hiring managers. Once these professionals get their foot in the door, they will receive between 28,000 and 40,000 pounds per year depending on position. As well, many green construction employees receive stock options through their company which provide a nice bonus on an annual basis.
